SUMMARY

Experienced Full Stack Engineer with 3 years of success in designing and scaling high-performance, distributed systems. Proficient in **Java, Spring Boot, and React.js**, with hands-on expertise in **microservices, event-driven architectures**. Experienced in **developing full-stack applications** using **Spring Boot** and **React.js**, and deploying **cloud-native solutions on AWS**.

SKILLS

Programming Languages:	Java, JavaScript, C++, TypeScript
Databases:	MySQL, PostgreSQL, Oracle
Backend Development:	Spring Boot
Frontend Development:	React.js
Other Technologies:	AWS, Docker, Jenkins, Git, Liquibase, JUnit, Mockito, Microservices, Jsp, Servlet

EXPERIENCE

Software Development Engineer - SDE 2

Jan. 2023 - Present

[Nexdew Technologies](#)

Noida, India

- Worked on multiple projects including **TVG, CloudSynApps**, and **Boubyan Steps**, contributing to both frontend (React.js) and backend (Java Spring Boot) development.
- Designed and developed RESTful APIs using Spring Boot and successfully integrated them with frontend applications for seamless end-to-end functionality.
- Implemented and maintained microservice-based architectures, ensuring scalability, reliability, and modular development.
- Deployed and managed cloud-native applications on AWS, leveraging services like EC2 and S3,.
- Built and enhanced CI/CD pipelines to automate builds, testing, and deployments, improving development efficiency and release frequency.
- Optimized database performance and system reliability through efficient indexing, and caching strategies.

PROJECTS

TVG

- Designed and developed the back-office module from scratch, enabling new business functionalities using React and Spring Boot.
- Identified inefficiency in the system where multiple services were repeatedly generating the same Microsoft access token independently. Designed a centralized solution using an AWS Lambda function triggered every 40 minutes by EventBridge. The Lambda generates the Microsoft tenant access token and stores it in AWS Parameter Store, allowing all services to fetch the shared token instead of regenerating it. This eliminated redundant processing, improved performance, and ensured consistent authentication across all services.
- Optimized backend performance through caching strategies, reducing database hits and improving response time.
- Implemented unit and integration testing to ensure code reliability and smooth CI/CD delivery.
- Actively worked on Jira for sprint planning, task tracking, spikes, and provided weekly technical support.

- Created tenants on Microsoft Azure and implemented Single Sign-On (SSO) for secure authentication and user access.
- Built efficient ETL pipelines for bulk data processing and ingestion.
- Managed database versioning and migrations using Liquibase.
- Utilized Redux for state management, improving frontend performance and maintainability.
- Authored comprehensive API documentation to ensure easy adoption and integration across teams.
- Resolved dependency vulnerabilities, performed version upgrades, and maintained AWS infrastructure tags for backend services.
- **Tech Stack:** Java, Spring Boot, React.js, Redux, MySQL, Liquibase, AWS (EC2, S3, Elasticsearch), Microsoft Azure (Tenant Management, SSO Integration), CI/CD (Jenkins/GitLab Actions)

CloudSynApps

- Designed and developed a complete timesheet web application from scratch using React.js and Spring Boot, handling frontend, backend, and database independently.
- The earlier version of the application was built in Thymeleaf, but it lacked a modern UI and had performance challenges.
- Proposed and led the upgrade to Version 2, rebuilding the entire system using React.js and Spring Boot for a modern, responsive, and high-performance frontend-backend architecture.
- Used PostgreSQL as the primary database with efficient schema design and query optimization.
- Implemented Spring Security for authentication and authorization, ensuring secure access control.
- Built both employee and manager portals with role-based access and intuitive UI workflows.
- Deployed the application successfully to production and continued enhancing features to improve user experience.
- Implemented batch processing for bulk data uploads, improving performance and efficiency.
- Developed email scheduling functionality for automated notifications and reminders.
- **Tech Stack:** Java, Spring Boot, React.js, PostgreSQL

Boubyan steps

- Built the Boubyan Steps web application from scratch, developing the complete frontend in React.js and continuing backend development using Java Spring Boot.
- Designed the application for a campaign platform where users can track their steps, which are converted into scores and rewards.
- Implemented core business logic for activity tracking, scoring, and leaderboard functionality.
- Integrated RESTful APIs between frontend and backend for real-time data synchronization.
- Utilized MySQL for data storage, ensuring optimized schema design and efficient query handling.
- Used React Hook Form for smooth form handling, validation, and state management on the frontend.
- Improved overall app performance through effective API caching and frontend optimization.
- **Tech Stack:** Java, Spring Boot, React.js, MySQL

EDUCATION

Bachelor of Technology (CSE), Kurukshetra University
CGPA: 8.3

2018 - 2022
Panipat, India
